**Network Topology &
Critical Vulnerabilities**

02

**Target 1 (Critical
Vulnerabilities)**

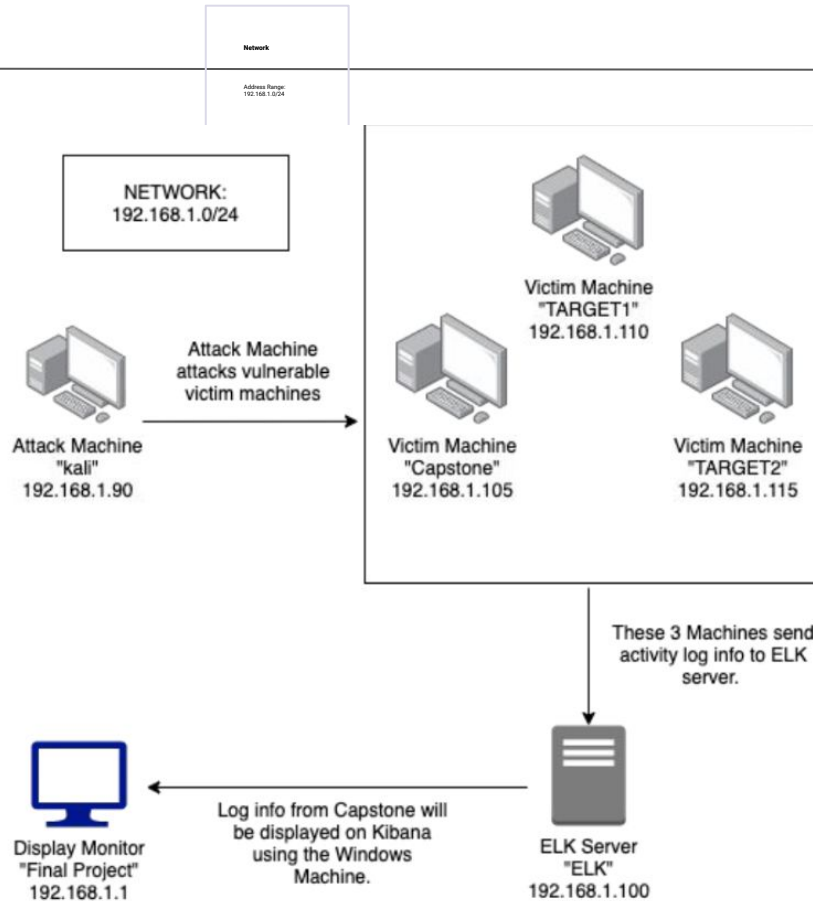

03

**Exploits Used + Avoiding
Detection**

The background of the slide is a dark red, almost black, geometric pattern composed of numerous triangles of varying shades of red and maroon, creating a complex, low-poly effect.

Network Topology & Critical Vulnerabilities

Network Topology

The background of the slide is a dark red, almost black, geometric pattern. It consists of a grid of squares, each of which is further divided into smaller triangles, creating a complex, low-poly visual effect. The word "Attack" is centered in the middle of the slide in a white, sans-serif font.

Attack

Target 1

Critical

Vulnerabilities: Target

1 Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
WordPress xml rpc pingback	Can be exploited by use of POST to a specific file on the affected wordpress server	Targets internal layers, and changes configs on devices
WordPress Vulnerability scanner	Determines which hosts are vulnerable to the GHOST vulnerability through a call to the wordpress interface	This means if the target is vulnerable, the system will fault and give back a server error
WordPress DoS	WordPress parsing is vulnerable to a XML based DoS (Denial of Service)	It affects WordPress 3.5 - 3.9.2

Critical

Vulnerabilities: Target

1 Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
WordPress Username and Password Login scanner	Attempts to authenticate against a wordpress-site, using multiple usernames and passwords	This could give login access
Cron WordPress Attacks	The PingBack feature, which is enabled by default, can be used to attack other websites	It can attack multiple websites, and also potentially slow down or even crash your website if misused.

Exploits Used + Avoiding Detection

Exploitation: Open Port 22 SSH and Weak Passwords

Summarize the following:

- How did you exploit the vulnerability?
 - We used wpscan to find the users and guessed the weak password in order to SSH into the system.
- What did the exploit achieve?
 - The exploit granted us user shell access for Michael's account. We explored the files to find flags 1 and 2

```
[i] User(s) Identified:

[+] michael
    Found By: Author Id Brute Forcing - Author Pattern (Aggressive Detection)
    Confirmed By: Login Error Messages (Aggressive Detection)

[+] steven
    Found By: Author Id Brute Forcing - Author Pattern (Aggressive Detection)
    Confirmed By: Login Error Messages (Aggressive Detection)
```

```

⚡ — flag1{b9bbcb33e11b80be759c4e844862482d} — ⚡
<script src="js/vendor/jquery-2.2.4.min.js"></script>
<script src="https://cdnjs.cloudflare.com/ajax/libs/popper.js/1.12.0/umd/popper.min.js"></script>
<script src="js/vendor/bootstrap.min.js"></script>
```

```
michael@target1:/var/www$ cat flag.txt
cat: flag.txt: No such file or directory
michael@target1:/var/www$ cat flag2.txt
flag2{fc3fd58dcdad9ab23faca6e9a36e581c}
michael@target1:/var/www$
```

Stealth Exploitation of Open Port 22 SSH and Weak Passwords

- SSH Login Alert would detect this exploit
- Monitor SSH Port for unauthorized access
- Triggers when user attempts to access system over Port 22

Mitigating Detection

- SSH through a different open port that is less obvious
- Other exploit ideas: reverse shell exploit

```
root@Kali:~# ssh michael@192.168.1.110
michael@192.168.1.110's password:

```

Exploitation:

WordPress

Summarize the following:

Configuration and SQL Database

- The username and password to access the SQL database were in plaintext in the wp-config.php file and not hashed as is best practice, however this is a limitation of wordpress.

What did the exploit achieve?

- The exploit granted us mysql access and allowed us to find flag 3. And it also gave the password hash for steven, which meant John could be used to crack the password

```
// ** MySQL settings - You can get this info from your web host ** //  
/** The name of the database for WordPress */  
define('DB_NAME', 'wordpress');  
  
/** MySQL database username */  
define('DB_USER', 'root');  
  
/** MySQL database password */  
define('DB_PASSWORD', 'R@v3nSecurity');
```

As a new WordPress user, you should go to your dashboard to delete this page and create new pages for your content. Have fun! | Sample Page | publish | closed | open | 0 | http://192.168.206.131/wordpress/?page_id=2 | 2018-08-12 22:49:12 | 2018-08-12 22:49:12 | 0 | page | 0 | 4 | 1 | 2018-08-13 01:48:31 | 0000-00-00 00:00:00 | flag3{afc01ab56b50591e7dccf93122770cd2}

Stealth Exploitation:

WordPress

Configuration and SQL

Database

Monitoring Overview & User Access

SQL Database Alert

- Monitor server traffic for unauthorized attempts to access SQL Database
- Triggers when external/unauthorized IP connections are made to the SQL Database or any related files.
- Least privilege should be used in this case to restrict user access to the configuration file.

Mitigating Detection

- Employ IP address spoofing
 - Brute-force SQL Database with Password cracking tool, Connect to the same network
-

Exploitation: Privilege Escalation

- We obtained Steven's password hash from the SQL database
- We cracked the password using John the Ripper and accessed his account
- We exploited Steven's python sudo privileges through a spawn shell
- The exploit achieve root access and allowed us to find flag 4

```
mysql> select * from wp_users;
+-----+-----+-----+-----+-----+
| ID | user_login | user_pass | user_nicename | user_email |
+-----+-----+-----+-----+-----+

CONGRATULATIONS on successfully rooting Raven!

This is my first Boot2Root VM - I hope you enjoyed it.

Hit me up on Twitter and let me know what you thought:

@mccannwj / wjmccann.github.io
root@target1:~#
```

Stealth Exploitation of Privilege Escalation

Monitoring Overview

- Privilege Escalation Alert
- Monitor unauthorized root access attempts as well as “super-doer” activity
- Triggers when unauthorized sudo command usage or privileged directory access is attempted by unauthorized users, regardless of report flagging.

Mitigating Detection

- Finding vulnerabilities in the kernel and exploiting them for root access
-

Defence

Critical Vulnerabilities: Target 1

Our assessment uncovered the following critical vulnerabilities in **Target 1**.

Vulnerability	Description	Impact
Open access to SSH	An attacker can try SSH logins if the port is left open	Open SSH is vulnerable to brute force attacks
Brute Force Vulnerability	Attackers can perform rapid attempts to guess user names and passwords	Brute force will, given enough time, gain access to the system
Enumerate Wordpress	Unsecured Wordpress allows for information gathering and vulnerability assessment	Wordpress stored usernames, greatly reducing the time required to brute force

Alerts Implemented

Excessive HTTP Errors

- Utilise Packetbeat to monitor *http.response.status_code*
- Implement a threshold of 400 for the last 5 minutes

```
WHEN count() GROUPED OVER top 5 'http.response.status_code' IS ABOVE 400 FOR THE LAST 5 minutes
```

HTTP Request Size Monitor

- Utilise Packetbeat to monitor *http.request.bytes*
- Implement a threshold of 3500 for the last 5 minutes
- Provide a screenshot of the alert in action.

WHEN sum() OF http.request.bytes OVER all documents IS ABOVE 3500 FOR THE LAST 5 minutes

CPU Usage Monitor

- Utilise Metricbeat to monitor *system.process.cpu.total.pct*
- Implement a threshold of 0.5 for the last 5 minutes

WHEN max() OF system.process.cpu.total.pct OVER all documents IS ABOVE 0.5 FOR THE LAST 5 minutes

Hardening

Hardening Against Open SSh on Target 1

There are a wide variety of hardening techniques for SSH. These can include:

- Set a custom TCP port by editing the */etc/ssh/sshd_config* file.
- Filter the SSH port through the firewall
- Implement SSH Passwordless Login. Uses keys to allow for login and removes the password prompt
- Disable empty passwords
- Set a custom SSH login banner. Doesn't stop logins but is a warning of active monitoring
- Keep SSH updated

Hardening Against Brute Force Vulnerability on Target 1

The simplest defense against a brute force attack is to implement an account lockout policy, however this leads to other forms of attack such as a Denial of Service or username harvesting.

Other defenses include

- Implement a strong password policy
- Multi factor authentication
- Captcha
- Asking a 'secret question' after two failed login attempts

Hardening Against Wordpress Enumeration on Target 1

As Wordpress is a website builder with a large range there are many security aspects to consider:

- Keep Wordpress up to date.
- Disable **REST API** and **XML-RPC** if they are not being used
- Configure your web server to block requests to **/?author=<number>**
- Don't expose **/wp-admin** and **/wp-login.php** directly to the public Internet

Implementing Patches

Implementing Patches with Ansible

Playbook Overview

Ansible will be used to automatic the update process on each machine. This process can be scheduled to run on a regular basis through cron job. The following updates the Linux-based webserver:

name: System Update

hosts: webservers

apt: update_cache=yes force_apt_get=yes cache_valid_time=3600

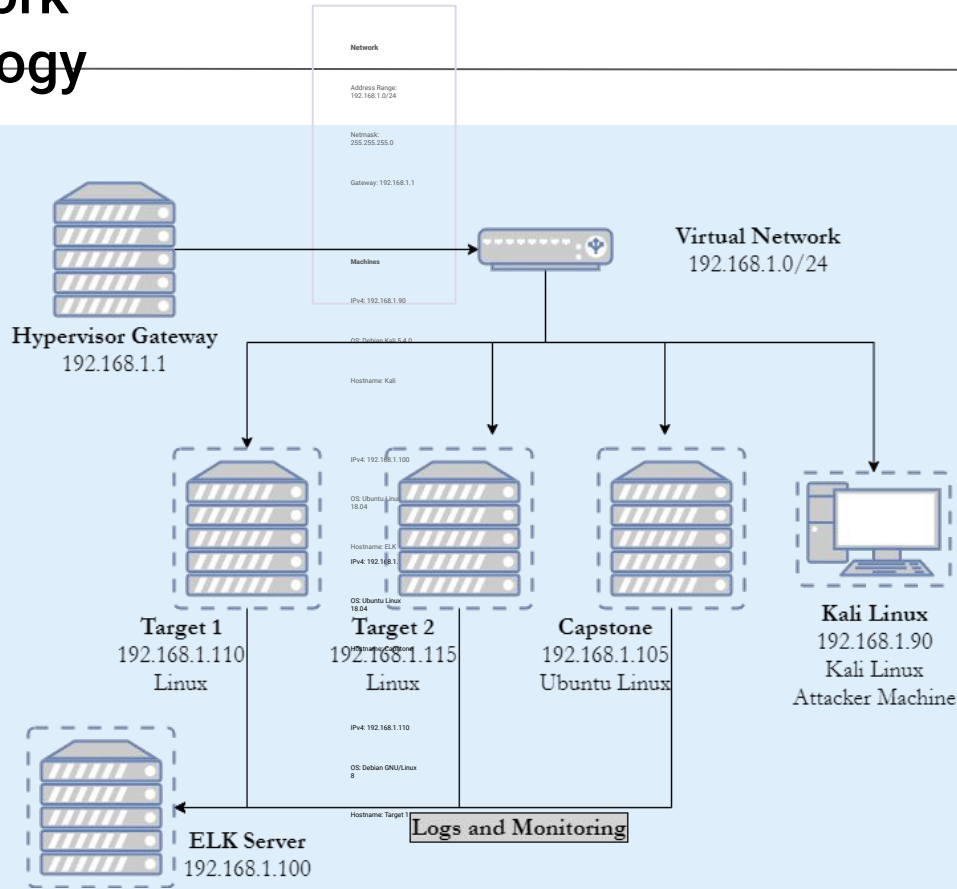

- name: reboot

- register: reboot_required_file

- stat: path=/var/run/reboot-required get_md5=no

Network Topology & Critical Vulnerabilities

Network Topology

Traffic Profile

Traffic Profile

Below are the identified top talkers, most common protocols, traffic on the network:

Feature	Value	Description
Top Talkers (IP Addresses)	172.16.4.205 166.62.111.64 10.0.0.201	Machines that sent the most traffic.
Most Common Protocols	Packets / Bytes TCP 88.5% / 89.6% UDP 11.0% / 0.1%	Three most common protocols on the network.
# of Unique IP Addresses	808 IPv4	Count of observed IP addresses.
Subnets	10.0.0.0/24 10.6.12.0/24 172.16.4.0/24	Observed subnet ranges.
# of Malware Species	1 - june11.dll (Trojan)	Number of malware binaries identified in traffic.

Behavioral Analysis

Purpose of Traffic on the Network

Users were observed engaging in the following kinds of activity.

"Normal" Activity

- Browsing the web
- Watching Youtube

Suspicious Activity

- Malware Infection
- Illegal file downloads

-

Normal Activity

Browsing the Web

- Normal usage, browsing a wordpress framework based website.
- Normal use of HTTP

6038	84.777839000	172.16.4.205	54.230.89.184	HTTP	416 GET /forms-cache/139743/182416/index-1469573231.html HTTP/1.1

Detailed View of Packet 68972:

Frame 68972: 262 bytes on wire (210 bytes captured) on interface 0
Ethernet II, Src: Msi...
Internet Protocol Version 4, Src: 10.0.0.201, Destination: 216.58.218.206
Transmission Control Protocol, Src Port: 49814, Destination Port: 443
Transport Layer Security, Seq: 1, Len: 262

The detailed view shows the TLS handshake process, including the Client Hello message and the Server Hello message.

Malicious Activity

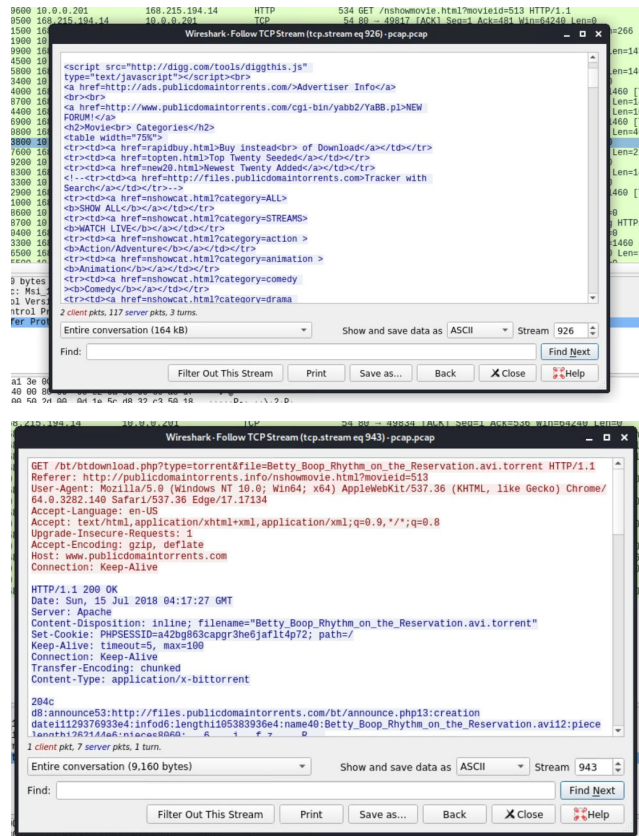

- Malicious file download "june11.dll"

Illegal File Downloads

- Browsing for copyright material on public bittorrent tracker
- Downloading and fetching torrent data
